

CANTINA

PERENNIAL RYEGRASS

Valley Seeds production agronomist assessing Cantina seed crop in Gippsland, Victoria.

Cantina is a long rotation ryegrass with excellent persistence

- ✓ High-yielding plants were selected from a 15-year-old perennial ryegrass pasture in South Gippsland
- ✓ Background breeding contains New Zealand and Spanish germplasm for higher winter production
- ✓ Where summer rainfall occurs, hybrid breeding also enables improved summer growth
- ✓ New persistent, late heading perennial ryegrass

Handy Tip:

Cantina contains wild type endophyte. Use as a component in a pasture blend. Avoid grazing too low, when seed heads are present or when stressed in autumn. Ensure hay is baled at correct moisture content.

QUICK FACTS

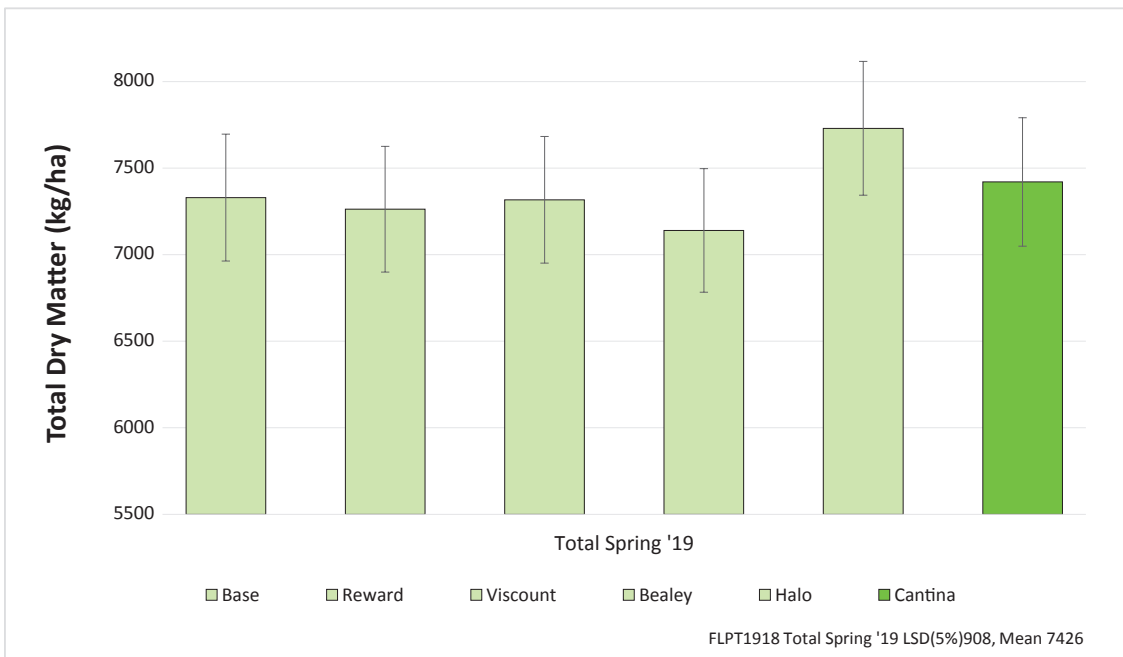

- Tetraploid hybrid
- Long rotation ryegrass
- Strong persistence
- High feed quality
- High yielding
- Late heading
- Rainfall 700mm+ or irrigation
- Suited to medium to high fertility soils
- Sow in autumn or spring if conditions are suitable
- Sowing rate 20-30kg/ha
